Orientation of Radiation:

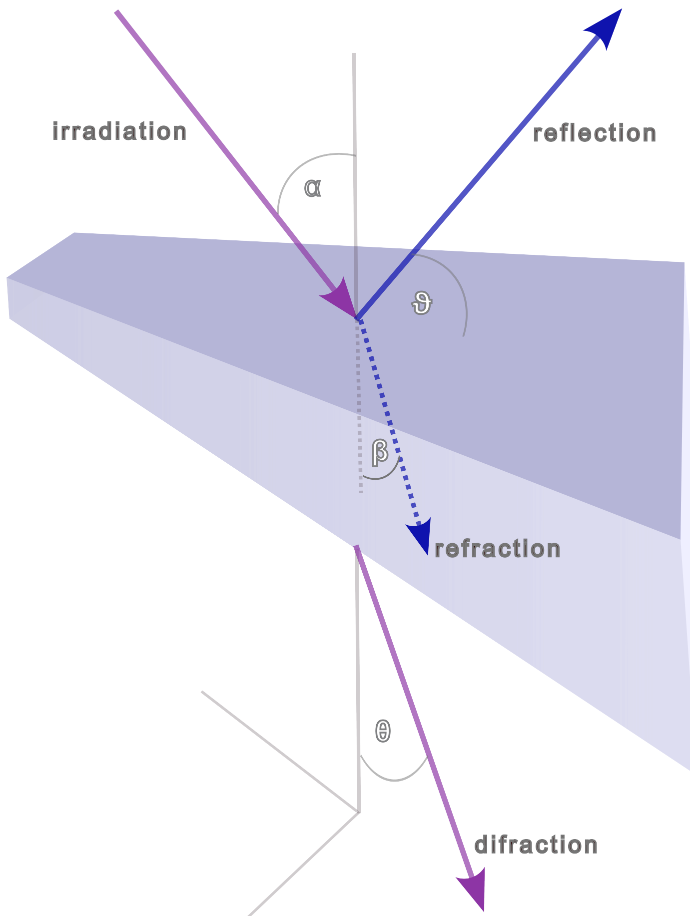

Figure 1: Radiation

$\vartheta =$ reflection angle for redirected radiation $A_{r\parallel}$ parallel to α from matter [1]

$\theta =$ diffraction angle for redirected radiation $A_{r\perp}$ orthogonal to α from matter [2]

$\varpi = \beta_1 + \beta_2 =$ angle of converging body surfaces (point tip of prismic medium), spread angle of prism

[1] Abstrahlwinkel zur Grenzfläche des Mediums
[2] Beugungswinkel durch Objekt ins Vakuum

© Update at eugenionet.github.io/physecon, eugenionetweb@gmail.com

ς = deviation angle of redirected ray beam after refraction (transmission) and diffraction

u_g = aperture angle (acceptance) from sender source (at distance g)

w_b = inclination angle at observer receiver (at distance b)

ε = visual angle from observer/receiver (of eye)
